

```
7  function addToCart() {  
8    var coupElem= $("#couponButt");  
9    selItem= getItemInfo($(this));  
10   for(var i=0; i<availItems.length; i++){  
11     if(availItems[i].name == selItem.name)  
12       availItems[i].count -= selItem.quantity;  
13   }  
  ...  
}
```

The diagram illustrates the scope resolution for the variable `selItem`. A dashed box encloses the declaration `selItem = getItemInfo($(this));` on line 9. Two arrows originate from this box: one points to the `selItem.name` property access on line 11, and the other points to the `selItem.quantity` property access on line 12, indicating that the `selItem` variable is resolved within the function's local scope.
