

```
14 function addToCart() {  
  :  
  :  
  :  
22  if(!coupon.expired){  
23    coupElem.removeClass(customer.couponStatus);  
24    customer.couponStatus= coupon.Id + '-' + 'used';  
25    price -= coupElem.data('value');  
26    coupElem.addClass(customer.couponStatus);  
  :  
  :  
  :  
  }  
}
```

The diagram illustrates the reuse of the variable `customer.couponStatus`. A dashed box highlights its use in `removeClass` on line 23. Another dashed box highlights its use in `addClass` on line 26. A curved dashed arrow points from the `customer.couponStatus` in line 26 back to the `customer.couponStatus` in line 24, indicating that the variable is updated and then used again within the same function scope.
